

P5 - Architecture & Configuration

Project Summary

I built a small business network in Cisco Packet Tracer using a Cisco 2911 router and three Cisco 2960 switches. I configured three separate IP networks, connected PCs, laptops, printers, and a server, and configured the router interfaces to allow communication between the different subnets. I then tested the network using ICMP traffic and Packet Tracer’s simulation tools to verify connectivity and troubleshoot the network.

Project Outcome

This project gave me hands on experience building a small business network from the ground up in Cisco Packet Tracer. I worked with multiple network segments, switches, a central router, end-user devices, printers, and a dedicated server network.

Working through the project helped me better understand how IP addressing, routing, switching, and network segmentation come together in a real network environment. I also gained experience configuring Cisco devices, troubleshooting connectivity issues, and testing communication between different parts of the network.
